DevSecOps technology frameworks

DevSecOps technology frameworks support automation of DevSecOps workflows by integrating security tools into a common ecosystem. This enables seamless, automated security across development, delivery and deployment.

DevSecOps technology frameworks:

- Do-it-Yourself Platforms (DIY)
- CI/CD Platforms
- Value-Stream Management Platform (VSMP)
- Automated Release Orchestration (ARO) Platforms
- platform engineering.

Scans and testing

Unit testing (automated)

- testing of the smallest piece of code that can be **logically isolated**
- function, subroutine, method, or property.

Static analysis (automated)

- debugging before the program is run
- analyse code against coding rules
- Sonarqube, Veracode (SAAS) , Fortify (HP).

Regression (automated)

- Re-run functional and non-functional tests to ensure software performs after a change.

Dynamic analysis (partially automated)

- Execute to find errors while program is running.
- Dynamic analysis does not look for code errors in program but in functions.
