# Metrics maturity

# Start where you are

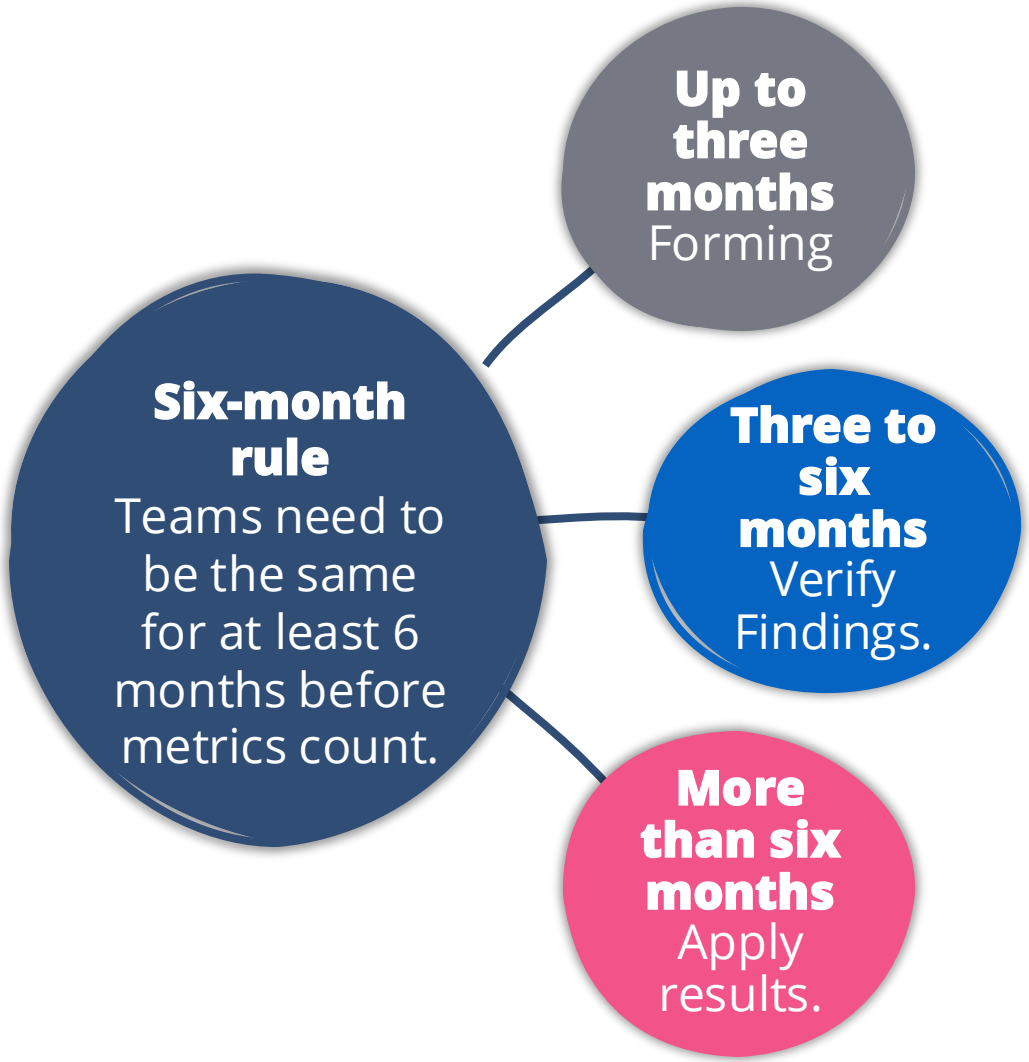

**Before changing, realize where you are today.**

**How do you find out where your process is?**

- Surveys and assessment
- Metrics; repeatable, contextual data
- Sensing sessions
- Problem identification.

**Know where you want to go!**

- Do metrics exist?
- Do they measure needed areas?
- Do you trust your metrics?

# Selecting metrics

By following these steps, organizations can effectively select and prioritize outcome metrics that not only provide a clear indication of performance but also drive meaningful improvements aligned with strategic goals. The set of metrics should be relevant and balanced.

# Creating a metric

- **Start with what is being measured:**
  - time
  - Completion of deliverables
  - Units of work
  - actions.
- **What action needs to be accomplished?**
  - metrics drive action
  - non-actionable metrics are noise.

# Advancing lead time to change

## How long does it take to complete an action?

- story points
- stories/epic
- work in progress.

## Identify constraints?

- How often do you think about value streaming change?
- Who built it? Who assigned tasks? Why?
- Do you measure complexity?
- Manage team structures for assigned versus complete.
- What are the parameters?

# Advancing deployment frequency

## How long from delivery to production?

- Did you identify constraints?
- How do you know?
- Mark premises (identify dependencies).

## Test success ratios

- What makes success?
- Why do those factors matter?
- What tools have you implemented to measure factors?
- How do you know?

## Assumptions about change

- Identify all your assumptions.
- Write assumptions down.
- Update regularly.

## What about security?

- Does changing security levels alter deployment times?
- Do you measure security impact on time?

Copyright© 2025 PeopleCert International Ltd.

# Advancing time to restore

## When do you recall?

- How much of system is on blue/green, canary, or other deployments?
- SLA implementation.

## Root cause for failure

- Time to Discover
- Time to Remediate
- Security; Root cause versus attribution: is it a solution or a delay?

## Factors leading to failure

- factors leading to slower restore time
- items to improve restoration
- notification chains.

# Advancing Change Failure Rate (CFR)

## Find the why

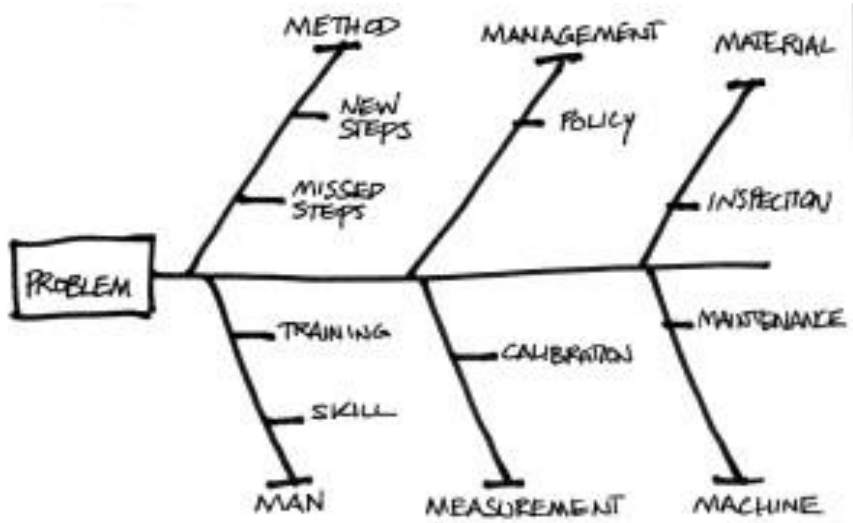

- Simon Sinek: start with why.
- John Doerr: measure what matters.

## Compare the why

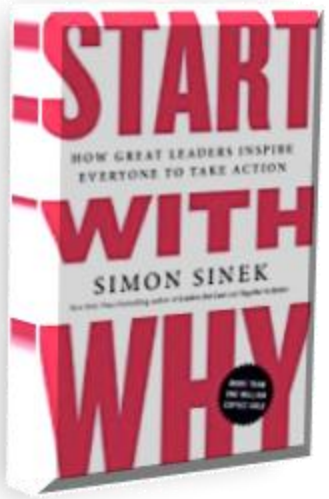

- How does this failure compare to past failures?
- What makes it a failure? Ops, Dev, Sec?
- Partial success.

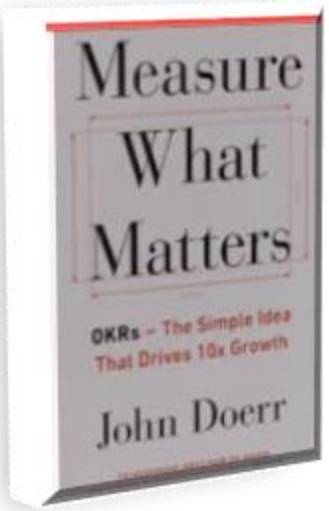

## Root cause

- Early Identification: fail early.
- Gather the group: learn quick.
- Failure creates opportunity for success.
- Identify the premises around the failure.
