Infrastructure engineers

What should my infrastructure engineer do?

- Design.
- Build.
- Deploy.
- Maintain.

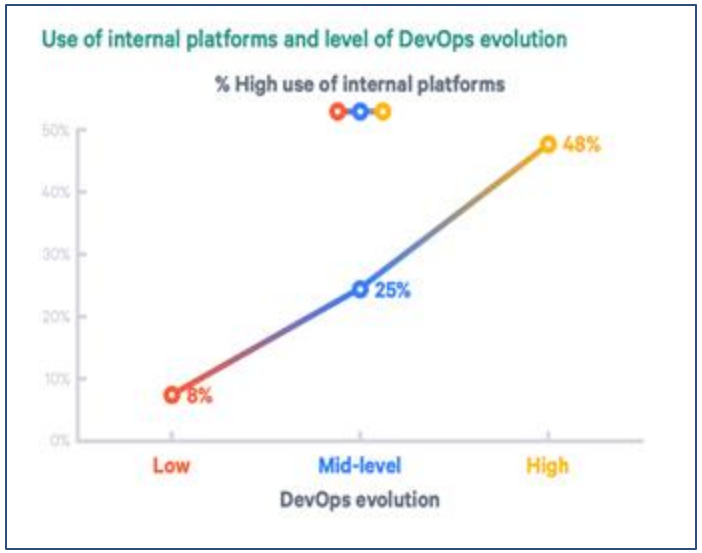

Where can my infrastructure engineer fit?

- cross-functional Dev team
- platform team
- operations
- security.

Platform engineering teams

- You build it, you run it. But....
- build internal workflows and tooling
  - Dev team for the Dev team
  - shields developers from infrastructure complexity
  - internal shared service to accelerate Dev process.
- build tools to support speed, quality and performance
- need deep technical skills and design specialization
- platform as a product.

Lift and shift

Migrate an application and associate data to the cloud without redesign:

- quick cost savings
- path to the cloud now
- disaster recovery
- relieve some technical debt.

Other potential options: the 5 Rs model

- **Rehost:** move hardware without changing architecture.
- **Refactor:** run apps on cloud provider infrastructure.
- **Revise:** modernize code than go to one of first two.
- **Rebuild:** throw out current app code and redesign.
- **Replace:** remove old apps and go commercial/open source.

Updating and repairing

All systems need patches, updates, and replacement

- CVEs describe new flaws.
- Infrastructure develops flaws.
- Identify end of life/out of support possibility.

Challenges

- missing a patch
- checking for unpatched devices
- external vulnerability scans
- internal vulnerability scans.
