GitOps (1/2)

- **Unified source of truth:** centralized and transparent repository for application and infrastructure configurations.
- **Enhanced security:** enables secure, pull-based workflows that minimize exposure to external threats.
- **Automated and consistent deployments:** GitOps tools automate the deployment process, ensuring consistency across environments.
- **Real-time drift detection and reconciliation:** GitOps tools continuously monitor the actual state and reconcile it with the desired state.
- **Improved collaboration and transparency:** fosters collaboration by making changes visible in repositories.
- **Simplified compliance and auditing:** configurations and deployments are version-controlled and auditable.
- **Faster incident response:** simplifies rollbacks by allowing teams to revert to previous states stored in Git.

GitOps (2/2)

GitOps acts as the single source of truth for managing infrastructure and application deployments.
