Revisiting the Third Way for DevSecOps

The Third Way for DevSecOps

- Structured experiments allow for completed value.
- Find balance in discussions

Finding where to start

Experiments should be limited by visibility:

- Stick with areas one can see.
- Work with real users.
- Achieve consensus outcomes.
- Prototype and test.

Basic experiments:

- Walking skeleton
- Minimum Viable Product (MVP).

Three key details:

- Empower teams.
- Provide information and context.
- Leave details to workers.

Qualitative and quantitative analysis

Qualitative

- expressed in words
- used to understand concepts
- gather in-depth insights
- key terms: understanding, context, complexity, subjectivity.

Collection methods

- Interviews: verbal open-ended questions.
- Focus groups: group discussion to gather opinions.
- Ethnography: participate in community to observe culture.
- Literature review: survey other work.

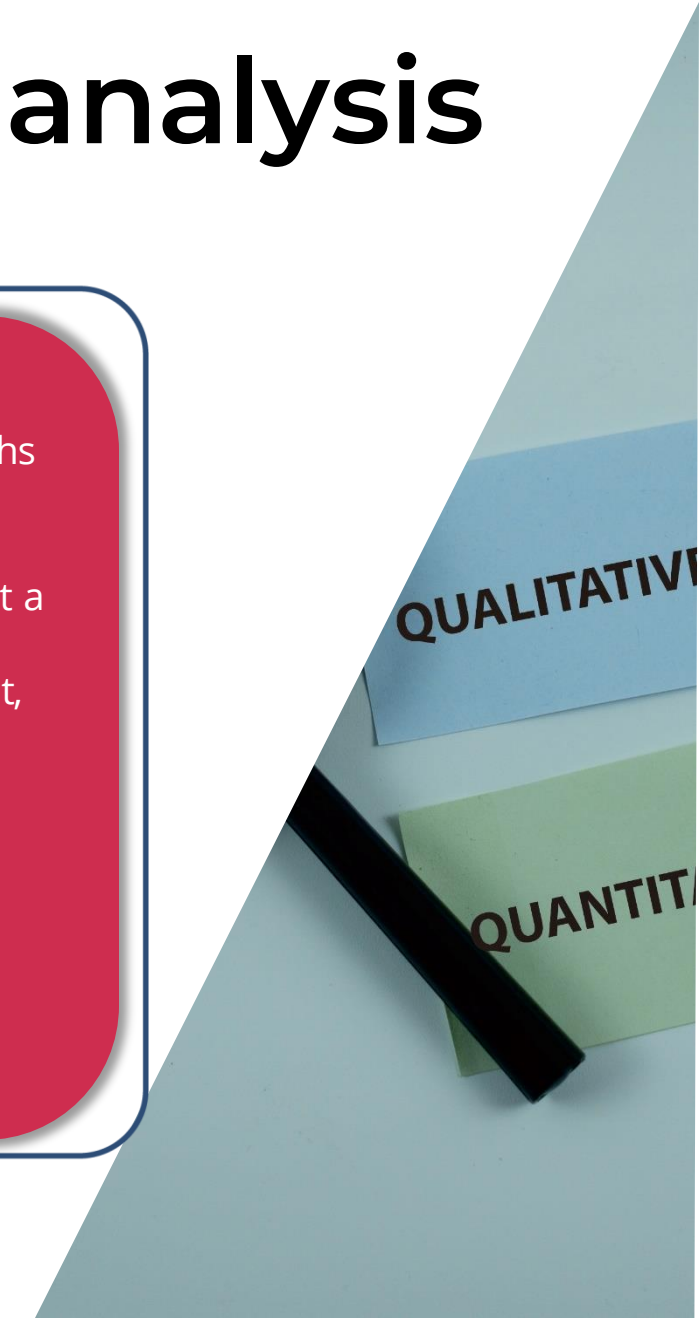

Vs

Quantitative

- expressed in numbers and graphs
- test and confirm theories/assumptions
- creates generalizable facts about a topic
- key terms: testing, measurement, objectivity, replicability.

Collection methods

- Survey
- Experiment
- Observation.

Data analysis

- Too much data is worse than not enough.
- Structure an analytical approach.
- Create a clear path to analysis.
- Understand associated factors.
- Do not cut based on instinct, cut based on output.

Keys to data analysis

- Define the story you want to tell.
- Verify source credibility.
- Automate everything.
- Measure twice, cut once.
- Present data in a meaningful manner (apples to apples).

Components of analytics

Data visualization
- Dashboard
- Tables
- Interactives
- Graphs and charts.

Data governance
- Formulate.
- Conduct.
- Build.
- Enhance.

Optimization
- Speed
- Response
- Efficiency.

Data acquisition
- DAQ Devices
- apps and drivers
- sensors.

Roadmap
- Validate.
- Strategy.
- Track.

Insights and analytics
- Identify.
- Interpret.
- Value.

Data security
- Signal.
- Guard.

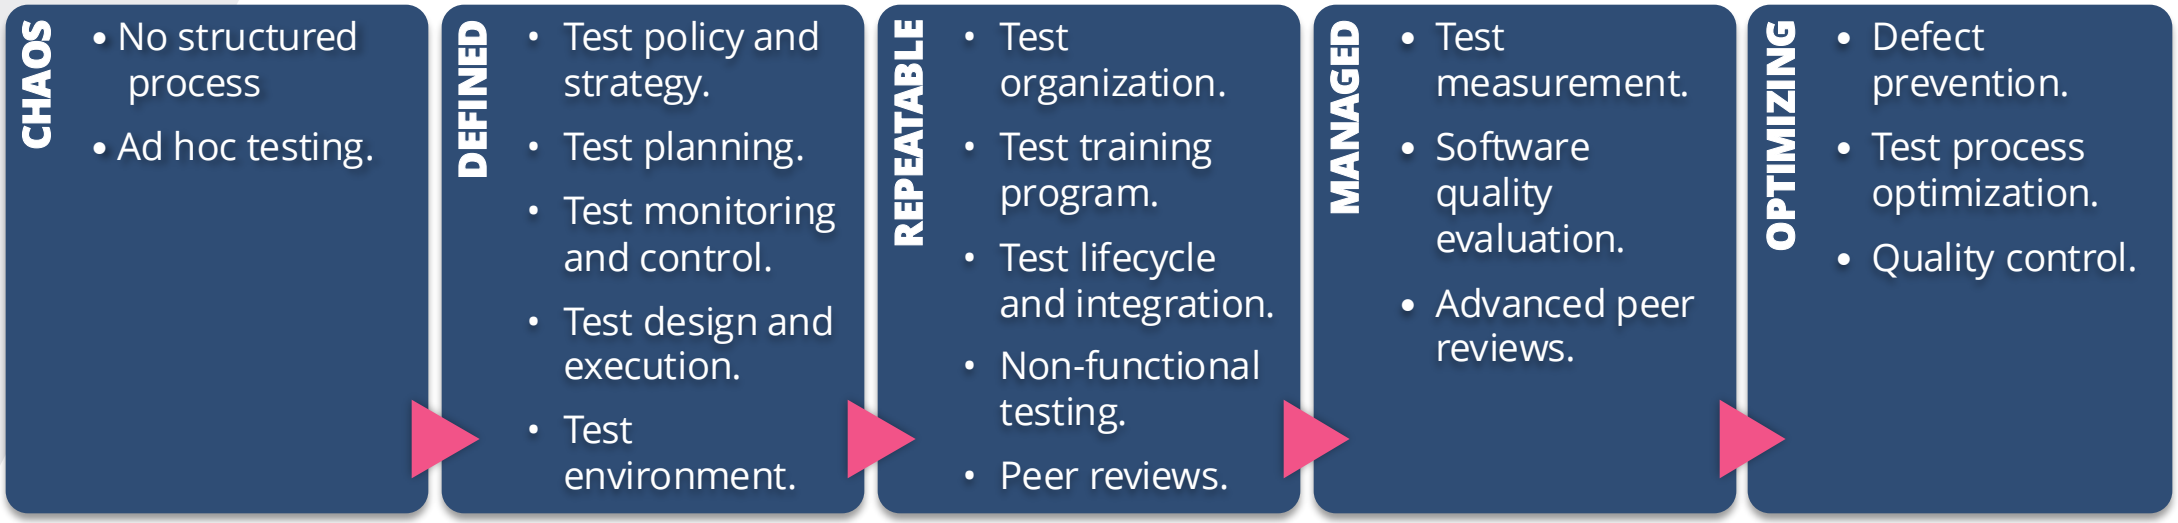

Data storage
- Object.
- File.
- Block.

Experimental maturity

Experimental maturity follows testing protocols

- Substitute experiment for test and move ahead.
- Key factors: process driven, defined environments, peer reviewed.
