Who gets to experiment?

Developers

- How does changing class or object affect outcome?
- Try altering pipeline tools.
- Shift language for technical debt.
- Consolidate language for technical debt.

Security

- Change scanning tool or integrate to pipeline.
- Automate compliance practices.
- Shift language for technical debt.
- Consolidate language for technical debt.

Operations

- Change rate of observation.
- Change teams associated with fixes.
- Alternate control boundaries.

Management

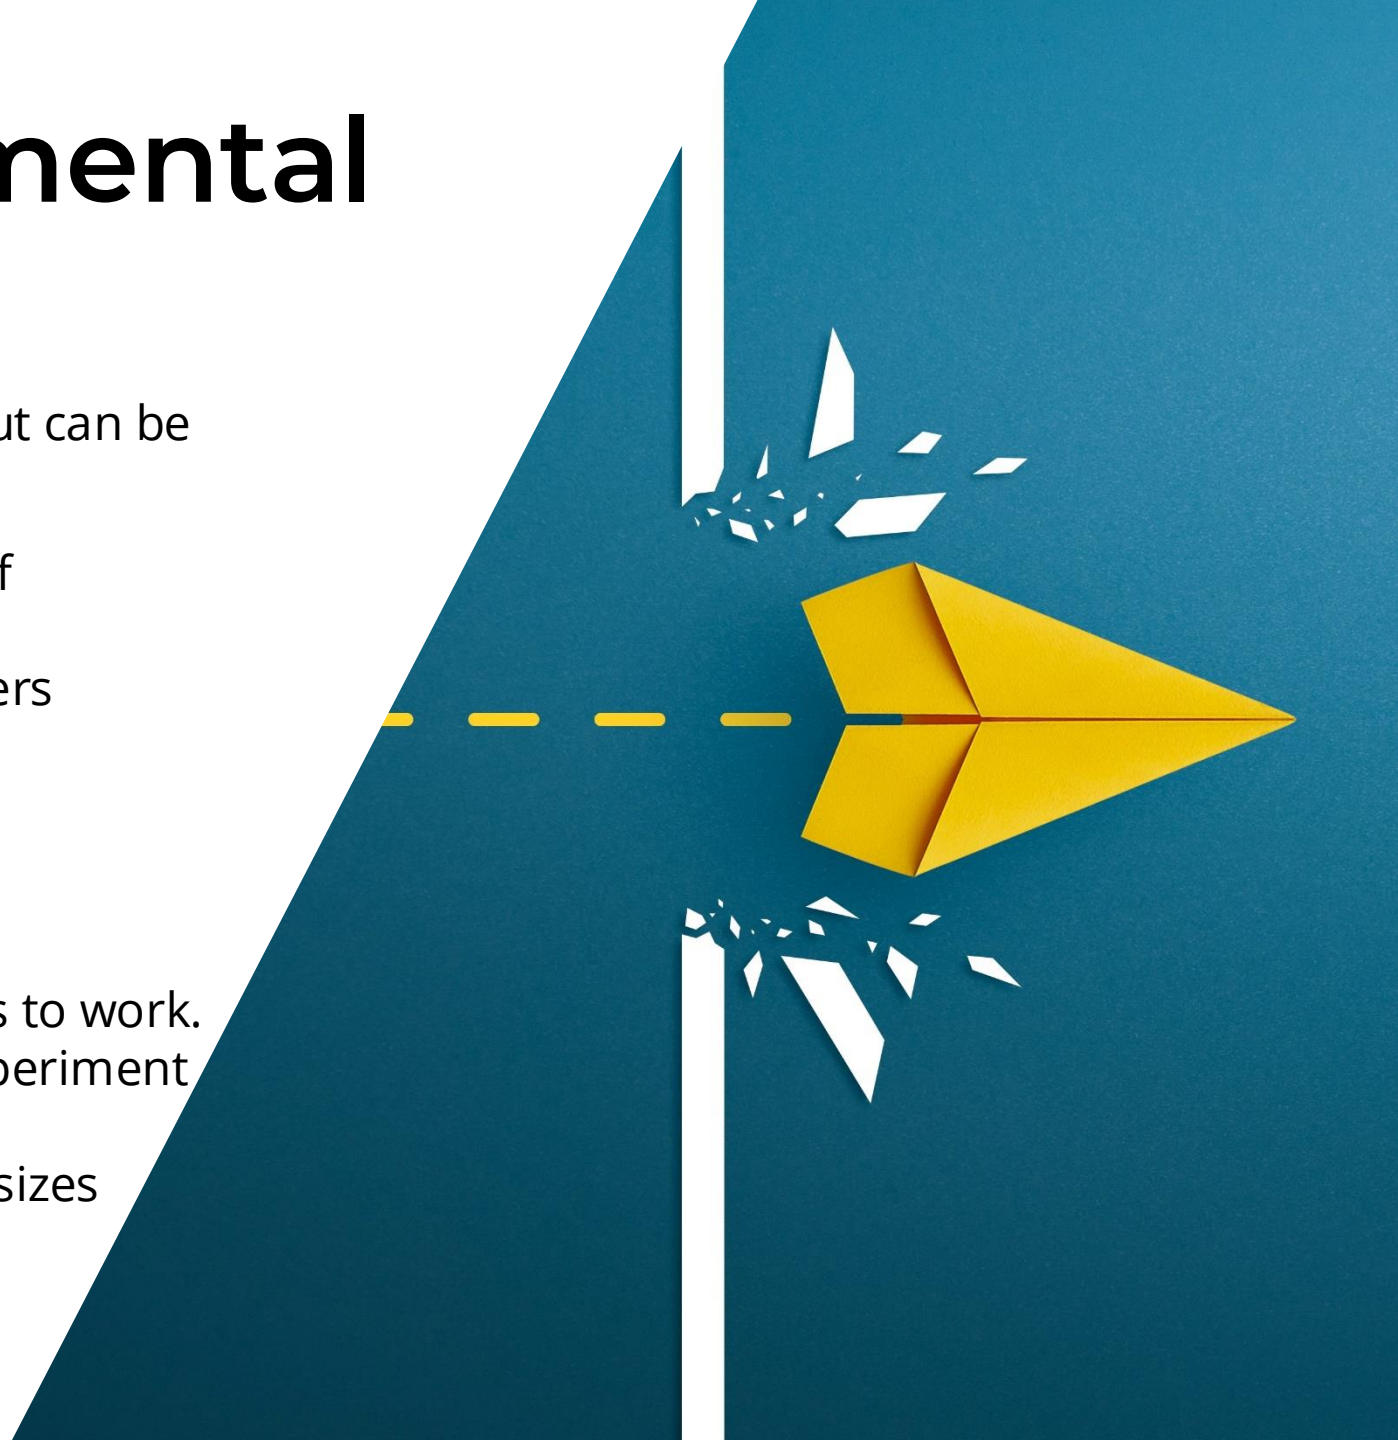

- Training results for teams.
- Value modification for value stream.
- Organizational cultural changes.

Pitfalls of experimental culture

- Experiments can drive improved success but can be challenging.
- **Challenge number 1:** ignore importance of experimentation.
  - treatment of technical staff as order-takers
  - lack of empowerment
  - limitation of need.
- **Challenge number 2:** no opportunity for experiments.
  - Lack of time: changing innovation sprints to work.
  - Lack of environments: no designated experiment labs.
  - Lack of support: management deemphasizes goals.

Improving team experiments

Hold regular Hackathons:

- structured/unstructured
- competitive atmosphere
- shared knowledge.

Encouragement:

- Focus on increased speed.
- Focus on improved delivery.
- Focus on quality changes.

Customer interaction.

Build experimental opportunities into the work cycle.

Holding a Hackathon

Set a functional task:

- Fix a problem.
- Create an app.
- Pose a solution.

Establish limits:

- Time: week/day/hours.
- Resources: team/group/individual.

Declare a winner:

- Share knowledge.
- Incorporate into next MVP.

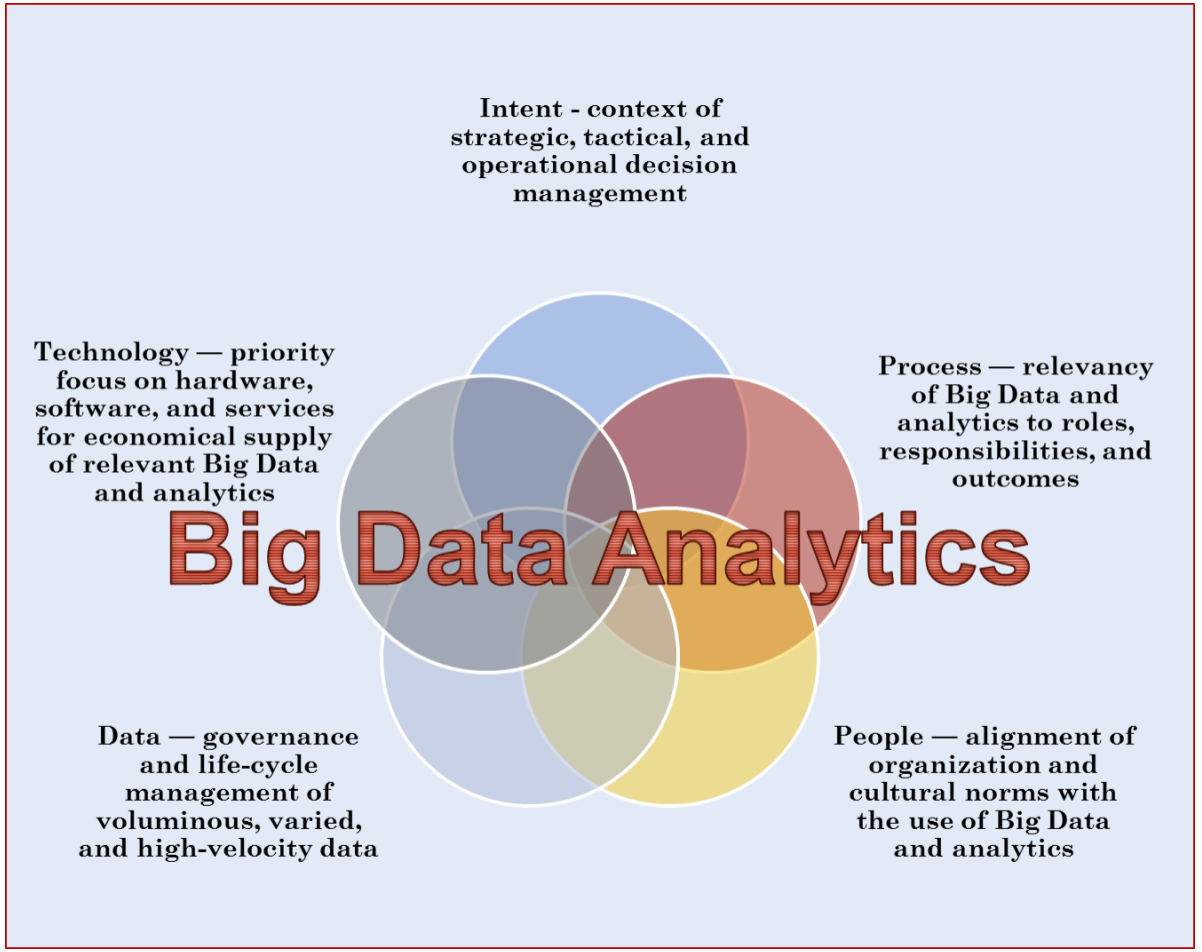

Hackathons create valuable competition and inspire learning.

Big data outcomes

- **Big data are more common on larger platforms.**
- **Conceptualize information overload.**
- **5 Vs of Big Data**
  - Velocity: speed of acquisition.
  - Volume: amount of data.
  - Value: importance of data individually and aggregated.
  - Variety: difference in data types.
  - Veracity: how accurate data is collected.
